1. A GIT commit would be something like a snapshot or checkpoint of your local changes to the repository, and a GitHub push would upload those commits to GitHub so that others can see or modify them.

2. Version history would allow one to come back after a long period of time and be able to instantly see the workflow that eventually culminated in the final product. Thus, it would allow the author or any third party, if done correctly, to reproduce the code even if they did not have any info on how it was initially produced.

3. Passwords or keys should never be uploaded to GitHub because they are confidential and even if they are deleted, they might still exist in Git History.

4. It could help me keep track of my code, alter my code, and track my progress.
